

Part 1: AARRR Funnel Mapping for X

1. Acquisition – How users discover X

User Entry Points:

- Viral tweets/screenshots shared on:
WhatsApp, Instagram, LinkedIn
- Google search results (news, trends)
- Influencers embedding tweets
- App store discovery

Key User Actions:

- Click tweet link → land on web/app
- Install app or open web version
- Browse without login (limited)

Value Moment:

- “This is where conversations are happening in real time”

Drop-offs:

- Forced login after limited scroll
- No clear personalization initially
- Overwhelming/unstructured feed

2. Activation – First meaningful experience

Critical Actions:

- Sign up (email/phone/Google/Apple)
- Choose interests
- Follow accounts
- See first personalized feed
- Like / reply / repost / bookmark

Activation Moment (Aha!):

- “My feed reflects my interests”
- “I can engage in real-time conversations”

Strong Activation Signals:

- Following 5–10 relevant accounts
- First interaction (like/reply)

- Time spent in first session

Drop-offs:

- Poor follow recommendations
- Empty or irrelevant feed
- Cognitive overload (too much content)

3. Retention – Why users come back

Repeat Behaviours:

- Daily scroll (habit loop)
- Checking trends/news
- Engaging in threads
- Posting own content

Retention Drivers:

- Real-time updates (news, sports, memes)
- Social validation (likes, replies)
- Network effects (friends, creators)

Core Value:

- “Stay updated + be part of conversations”

Drop-offs:

- Toxic content / negativity
- Low engagement on own posts
- Algorithm fatigue (irrelevant content)

4. Revenue – Monetization points

Primary Streams:

- Ads in feed
- Promoted tweets/trends
- Subscriptions (X Premium)
- Creator monetization (ads rev share, subscriptions)

Value Exchange:

- Users → attention
- Advertisers → pay for reach

Gaps:

- Weak conversion to paid features
- Unclear value for Premium users

5. Referral – Organic growth loops

Referral Mechanisms:

- Sharing tweets externally (WhatsApp, LinkedIn)
- Embedding tweets in articles
- Viral threads/screenshots

Loop:

User posts → content spreads → new users discover → join → create more content

Weakness:

- Sharing doesn't always convert to sign-ups
- No strong incentive to invite friends directly

Funnel Summary

Stage	User Action	Value Moment	Drop-off Risk
Acquisition	Click tweet / install app	Real-time conversations	Login friction
Activation	Follow + first interaction	Personalized feed	Irrelevant content
Retention	Daily usage + engagement	Habit + social validation	Low engagement / toxicity
Revenue	Ads / subscription	Monetization	Weak premium value
Referral	Share tweets externally	Viral content loop	Low conversion to sign-up

Top Drop-off Moments Identified

1. **Post-landing → signup friction**
2. **Post-signup → weak personalization**
3. **Early retention → low engagement feedback**
4. **Referral → poor conversion from viewers to users**

Part 2: Gaps & Growth Opportunities (AARRR Analysis)

1. Acquisition – Discovery to Signup

Key Gaps:

1. High intent traffic, low conversion

Users frequently click on shared tweets from platforms like WhatsApp or LinkedIn but encounter a login wall quickly.

Missed Opportunity:

High-intent users are not converting into registered users.

2. Weak first-time visitor experience

The feed is not personalized before signup, and there is no clear value proposition presented upfront.

Behavioural Insight:

Users tend to drop off within seconds if they do not immediately see relevant content.

Why it matters

This is a top-of-funnel leakage problem. Even small improvements here can significantly increase user acquisition.

2. Activation – First Value Moment**Key Gaps****1. Poor follow recommendations**

Suggested accounts are often generic or celebrity-focused and do not align with user intent (e.g., finance, tech, memes).

Impact:

Users fail to see a relevant feed early on.

2. Lack of guided onboarding

There is no structured onboarding journey such as:

- Follow a minimum number of accounts
- Perform first interaction (like, reply)

Impact:

Users feel directionless and may drop off before experiencing value.

3. Weak “aha moment” creation

The first session is often noisy and overwhelming rather than rewarding.

Behavioural Insight:

Users who do not engage in their first session are unlikely to return.

Why it matters

Activation is the strongest predictor of retention. The current experience does not effectively guide users to value.

3. Retention – Habit Formation**Key Gaps**

1. Weak engagement feedback loop for new users

New users who post often receive little or no engagement.

Impact:

Lack of feedback reduces motivation to return.

2. Inconsistent content quality

The feed includes a mix of high-value content and irrelevant or low-quality posts.

Impact:

Users lose trust in the platform's content relevance.

3. Toxic or negative interactions

Public replies can be harsh, discouraging participation, especially for new users.

Impact:

Reduces willingness to engage and contribute.

4. Lack of personalized retention hooks

All users experience a similar feed structure regardless of intent.

Impact:

Different user segments (learning, networking, entertainment) are not effectively retained.

Why it matters

Retention is the core growth driver. Weak retention limits both monetization and organic growth.

4. Revenue – Monetization

Key Gaps

1. Weak value proposition for premium features

Users do not clearly understand the benefits of paid offerings.

Impact:

Low conversion to paid subscriptions.

2. Limited scalability of creator monetization

Only top creators benefit significantly, while smaller creators lack incentives.

Impact:

Reduces content creation and supply.

3. Ad experience lacks relevance

Ads may feel intrusive or poorly targeted.

Impact:

Negative impact on user experience and engagement.

Why it matter

Revenue growth depends on strong retention and a healthy creator ecosystem.

5. Referral – Organic Growth Loop

Key Gaps

1. Low conversion from shared content to signups

Users consume tweets externally but do not convert into platform users.

Impact:

Breaks the content-driven growth loop.

2. Lack of explicit referral incentives

There are no strong mechanisms encouraging users to invite others.

Impact:

Missed opportunity for viral growth.

3. Creators not incentivized to onboard their audience

Content is often shared as screenshots outside the platform.

Impact:

Loss of attribution and potential new users.

Why it matters

The platform's strength lies in content virality, but the conversion loop is inefficient.

Stage	Gap	Growth Impact
Acquisition	Login friction, weak first impression	Loss of new users
Activation	Poor onboarding, irrelevant feed	Low activation rate
Retention	Weak engagement loop, toxicity	High churn
Revenue	Weak premium value	Low monetization
Referral	Poor conversion from content to signup	Broken growth loop

Part 3: Define Epics to Drive Growth

Focus Areas

Based on the funnel analysis, the highest-impact stages are:

- **Activation** (critical bottleneck)
- **Retention** (drives long-term growth and monetization)

Epic 1: Personalized Onboarding & Feed Relevance Engine

Insight → AARRR Stage → Epic

- **Insight:** Users fail to see relevant content early → poor activation
- **Stage:** Activation
- **Epic:** Build a highly personalized onboarding and feed setup experience

What this includes

- Dynamic interest selection (not static categories)
- Real-time feed shaping based on:
 - Clicks
 - Dwell time
 - Early interactions
- Smarter follow recommendations (micro-communities, niche creators)
- “Starter packs” (curated account bundles for specific interests)

Part 3: Define Epics to Drive Growth

Focus Areas

Based on the funnel analysis, the highest-impact stages are:

- **Activation** (critical bottleneck)
- **Retention** (drives long-term growth and monetization)

Epic 1: Personalized Onboarding & Feed Relevance Engine

Insight → AARRR Stage → Epic

- **Insight:** Users fail to see relevant content early → poor activation
- **Stage:** Activation
- **Epic:** Build a highly personalized onboarding and feed setup experience

What this includes

- Dynamic interest selection (not static categories)
- Real-time feed shaping based on:
 - Clicks
 - Dwell time
 - Early interactions
- Smarter follow recommendations (micro-communities, niche creators)
- “Starter packs” (curated account bundles for specific interests)

How it improves user behaviour

- Faster discovery of relevant content
- Users reach the “**this feed is for me**” moment quickly
- Increases likelihood of:

- First interaction
- Longer first session

Why it aligns with growth strategy

- Directly improves **activation rate**, the biggest bottleneck
- Better activation → higher retention → stronger monetization and referrals

Epic 2: First Engagement Boost System

Insight → AARRR Stage → Epic

- **Insight:** New users receive little engagement → churn risk
- **Stage:** Retention (early retention)
- **Epic:** Ensure every new user gets meaningful early engagement

What this includes

- Algorithmic boost for first posts from new users
- “Welcome visibility” in relevant communities
- Prompts to encourage replies (e.g., guided posting templates)
- Notifications that highlight early engagement

How it improves user behaviour

- Creates a **positive feedback loop**
- Users feel heard and validated
- Increases:
 - Posting frequency
 - Return probability

Why it aligns with growth strategy

- Strengthens **habit formation**
- Encourages more content creation → fuels content loop
- Improves both retention and supply-side growth

Epic 3: Guided Interaction & Habit Formation Layer

Insight → AARRR Stage → Epic

- **Insight:** Users are not guided toward meaningful actions
- **Stage:** Activation → Retention
- **Epic:** Introduce guided actions to drive early habit formation

What this includes

- Onboarding checklist:
 - Follow 5 accounts
 - Like 3 posts

- Reply once
- Contextual nudges:
 - “Join this conversation”
 - “People are discussing this topic”
- Daily/weekly engagement prompts

How it improves user behaviour

- Reduces cognitive overload
- Encourages **active participation instead of passive scrolling**
- Builds early habits

Why it aligns with growth strategy

- Bridges gap between **activation and retention**
- Increases engagement depth, not just surface usage

Epic 4: Content-to-Signup Conversion Optimization

Insight → AARRR Stage → Epic

- **Insight:** Viral content does not convert viewers into users
- **Stage:** Acquisition + Referral
- **Epic:** Optimize external content consumption to drive signups

What this includes

- Improved logged-out experience:
 - More scroll before login wall
 - Contextual previews of threads
- Smart signup prompts:
 - “Join to follow this conversation”
 - “See more like this”
- One-click onboarding from shared links

How it improves user behaviour

- Converts passive viewers into active users
- Reduces friction in signup journey

Why it aligns with growth strategy

- Strengthens **content growth loop**
- Maximizes ROI from existing organic traffic

Epics Mapping:

Insight	AARRR Stage	Epic
Irrelevant early feed	Activation	Personalized onboarding & feed engine

Insight	AARRR Stage	Epic
No early engagement	Retention	First engagement boost system
Lack of guided actions	Activation/Retention	Guided interaction layer
Poor conversion from shared content	Acquisition/Referral	Content-to-signup optimization

Part 4: Prioritize Using RICE Framework

Objective

Prioritize the proposed growth epics using the **RICE Framework**:

- **Reach** = How many users affected in a given period
- **Impact** = Expected effect on key metrics (scale: 0.25 to 3)
- **Confidence** = Certainty of assumptions (%)
- **Effort** = Time / team effort required (person-months)

Formula:

RICE Score = (Reach × Impact × Confidence) / Effort

Epics Evaluated

1. Personalized Onboarding & Feed Relevance Engine
2. First Engagement Boost System
3. Guided Interaction & Habit Formation Layer
4. Content-to-Signup Conversion Optimization

RICE Scoring Table

Epic	Reach	Impact	Confidence	Effort	RICE Score
Personalized Onboarding & Feed Relevance Engine	90	3.0	80%	8	27.0
First Engagement Boost System	65	2.5	75%	5	24.4
Guided Interaction & Habit Formation Layer	75	2.0	85%	4	31.9
Content-to-Signup Conversion Optimization	85	2.0	70%	6	19.8

Final Ranking

Rank	Epic	RICE Score
1	Guided Interaction & Habit Formation Layer	31.9
2	Personalized Onboarding & Feed Relevance Engine	27.0
3	First Engagement Boost System	24.4
4	Content-to-Signup Conversion Optimization	19.8

Prioritization Summary

1. Guided Interaction & Habit Formation Layer (Top Priority)

Why first:

- Strong reach across new users
- Lower effort than heavy ML/personalization initiatives
- Directly improves **Activation + Retention**
- Fastest path to measurable lift in engagement

Expected outcomes:

- More follows, likes, replies in first week
- Higher week-1 retention

2. Personalized Onboarding & Feed Relevance Engine

Why second:

- High impact on first-user experience
- Solves core issue of irrelevant feeds
- More complex due to recommendation system dependencies

Expected outcomes:

- Better activation rates
- Longer first-session time spent

3. First Engagement Boost System

Why third:

- Important for creator-side retention
- Helps users who post early receive validation
- Slightly narrower reach than onboarding improvements

Expected outcomes:

- More returning posters
- Increased content creation

4. Content-to-Signup Conversion Optimization

Why fourth:

- Valuable, but should follow stronger activation systems
- No benefit in driving more signups into a weak onboarding funnel

Expected outcomes:

- Higher visitor-to-signup conversion later

Strategic Recommendation

Twitter/X should first optimize the **new-user experience** before pushing harder on top-of-funnel growth.

Priority order:

1. Improve activation behaviours
2. Strengthen retention loops
3. Then scale acquisition/referral conversion

The platform likely does not need more traffic first. It needs to convert and retain existing traffic better.
